Estimates from the 40 minute sample, which includes births from 11:37pm-11:55pm & 12:05am-12:24am. Additional variables used the main analysis (not shown) include mother age indicators, father age indicators, year of birth indicators and month of birth indicators. \*\* = significant at 1%; \* = significant at 5%.

Observations	35736	33920	33920	94879	94879	94879
Mean of Dep. Variable Before Midnight	0.028	0.028	0.028	0.029	0.046	0.046

40 minute sample includes births from 11:37pm-11:55pm & 12:05am-12:24am; 2 hour sample includes births from 11:02pm-11:55pm & 12:05am to 12:59am. Column (1) reports the difference in local linear regression estimates just above and below the discontinuity using a triangle kernel and a bandwidth of 20 minutes. Asymptotic standard errors in parentheses. Columns (2)-(4) report marginal effects evaluated at the mean of the covariates with robust standard errors reported in parentheses. Full controls include the controls listed in Appendix Table A1, as well as indicators for the mother's age, the father's age, the year of birth and the month of birth. Columns (5) and (6) report marginal effects from models that include a quartic in the residual from a regression of length of stay on the same variables that are included in this table. Robust standard errors in parentheses, 95% confidence interval of the bootstrapped t-statistics (500 replications) in brackets.

**Table A4: Time of Birth and 1-Year Mortality**

Full Controls	No	No	Yes	Yes	No	Yes
Sample	40 minute	40 minute	40 minute	2hour	2hour	2hour
Observations	35736	33157	33157	94761	94761	94761
Mean of Dep. Variable Before Midnight	0.0043	0.0041	0.0041	0.0048	0.0048	0.0048

40 minute sample includes births from 11:37pm-11:55pm & 12:05am-12:24am; 2 hour sample includes births from 11:02pm-11:55pm & 12:05am to 12:59am. Column (1) reports the difference in local linear regression estimates just above and below the discontinuity using a triangle kernel and a bandwidth of 20 minutes. Asymptotic standard errors in parentheses. Columns (2)-(4) report marginal effects evaluated at the mean of the covariates with robust standard errors reported in parentheses. Full controls include the controls listed in Appendix Table A1, as well as indicators for the mother's age, the father's age, the year of birth and the month of birth. Columns (5) and (6) report marginal effects from models that include a quartic in the residual from a regression of length of stay on the same variables that are included in this table. Robust standard errors in parentheses, 95% confidence interval of the bootstrapped t-statistics (500 replications) in brackets.

Compliers are newborns who are induced into having a longer stay due to a post-midnight births, where longer stays are defined as at least one additional midnight prior to the law change and at least 2 additional midnights after the law change. The means are then calculated as described in the text. The 40-minute sample is the analysis sample used in Table 3. The 24-hour population includes all births in California hospitals. The estimated fraction of compliers in the 40-minute sample is 16% prior to the law change and 17% after the law change.

Observations	558620		553139	

Law change occurred in August 1997, but exempted (some) Medicaid patients. Medicaid patients were covered by a law

**Table A7: Maternal Length of Stay & Outcomes**

Dependent Variable:	Before 1997 Law Change		After 1997 Law Change	
	Additional Midnights (1)	28-Day Readmission (2)	Additional Midnights (3)	28-Day Readmission (4)
Birth After Midnight	0.297 (0.086)	-0.0006 (0.0012)	0.229 (0.045)	0.0015 (0.0015)
Birth After Midnight * Minute from cutoff	0.0004 (0.0077)	-0.00002 (0.00007)	-0.0005 (0.0020)	-0.00004 (0.0001)
Birth Prior to Midnight* Minute from cutoff	-0.0008 (0.0025)	0.0000 (0.00008)	0.0022 (0.0018)	-0.0002 (0.00009)
Observations	57599	57597	33560	32869
Mean of Dep. Variable Before Midnight	0.685	0.008	0.968	0.008

Analyses uses the "40 minute" sample, which includes births from 11:37pm-11:55pm & 12:05am to 12:24am. Columns (1) and (3) are estimated with by OLS, and Columns (2) and (4) report estimates that are marginal effects from a probit model, evaluated at the mean of the covariates. All models include full controls. Robust standard errors reported in parentheses.

Analyses use the 2 hour sample, which includes births from 11:02pm-11:55pm & 12:05am to 12:59am. The additional midnight models are estimated by OLS, and the readmission and mortality columns report marginal effects from a probit model, evaluated at the mean of the covariates. Models for unmarried do not include missing observations and only include 2 years in the post-law change period. Robust standard errors reported in parentheses. All models include full controls listed in Appendix Table A1, as well as mother age indicators, father age indicators, year of birth indicators and month of birth indicators. Number of observations listed is for the mortality model, which is a lower bound on the number of observations in that row, as some cells have zero deaths. \*\* = significant at 1%; \* = significant at 5%.

Figure A1A: Low Birthweight vs. Minute of Birth:  
Before the Law Change

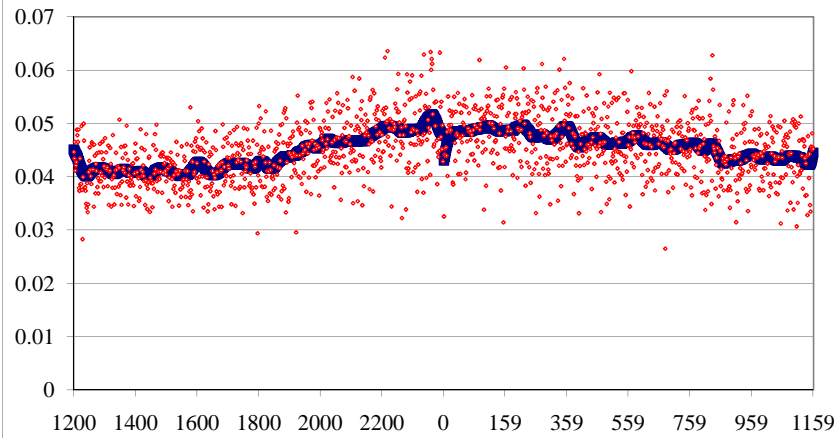

Figure A1B: P(28-Day Readmission|X) vs. Minute of Birth:  
Before the Law Change

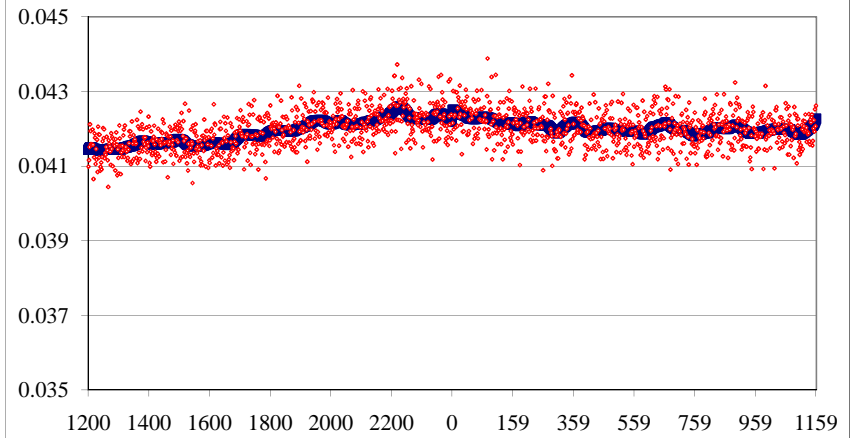

Figure A1C: Low Birthweight vs. Minute of Birth:  
After the Law Change

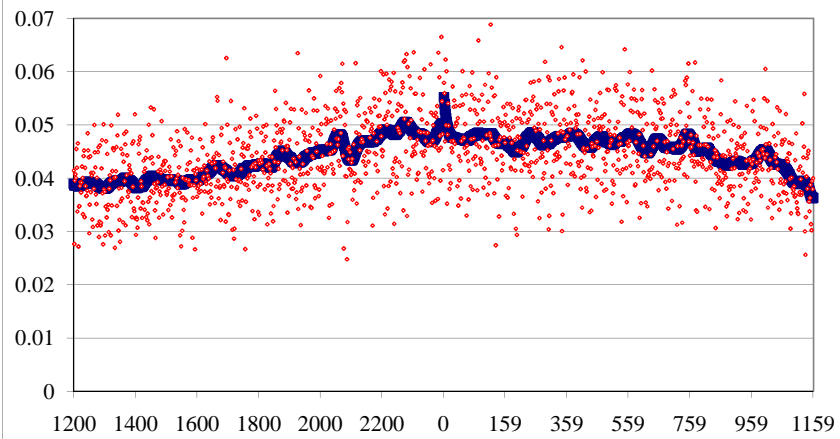

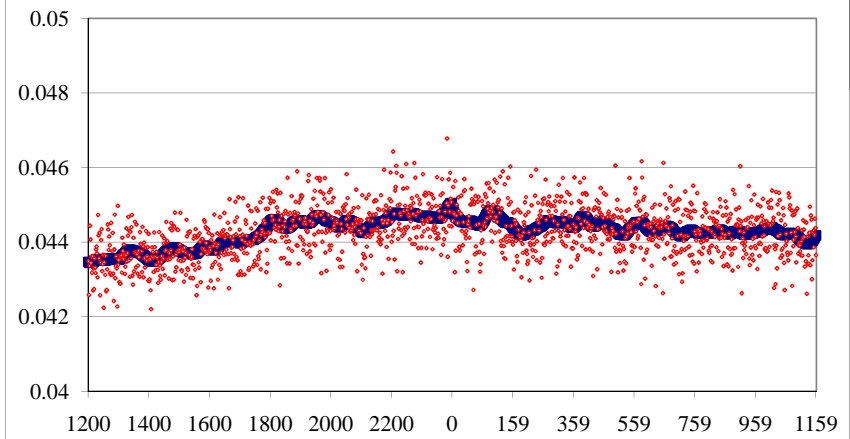

Figure A1D: P(28-Day Readmission|X) vs. Minute of Birth:  
After the Law Change

Cell minute means are shown in red; local linear regression estimates (with a bandwidth of 20) are shown in blue. Predicted P(28-day readmission) used a probit model and full controls.

Figure A2A: Raw Length of Stay: Before 1997 Law Change

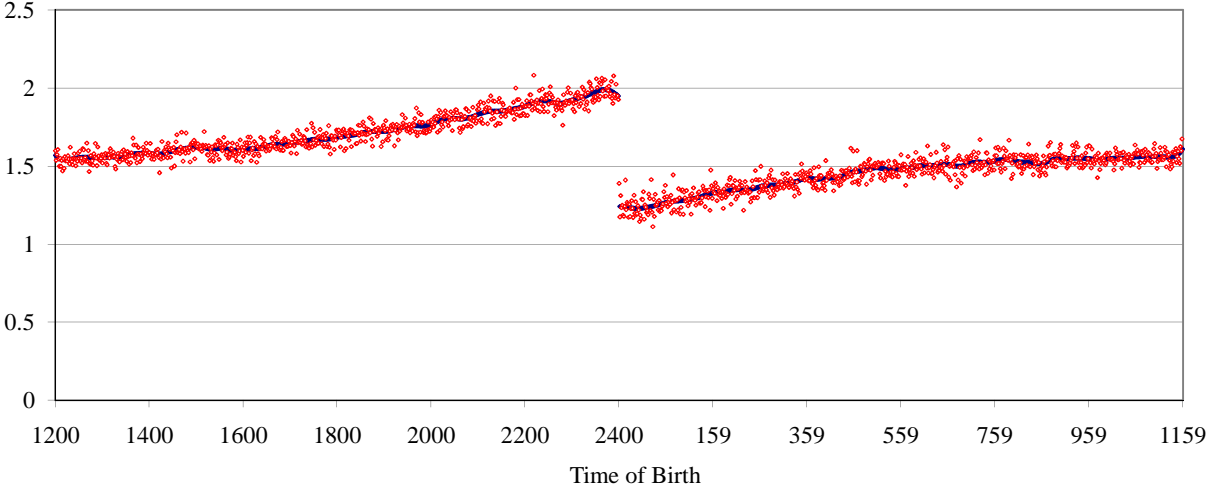

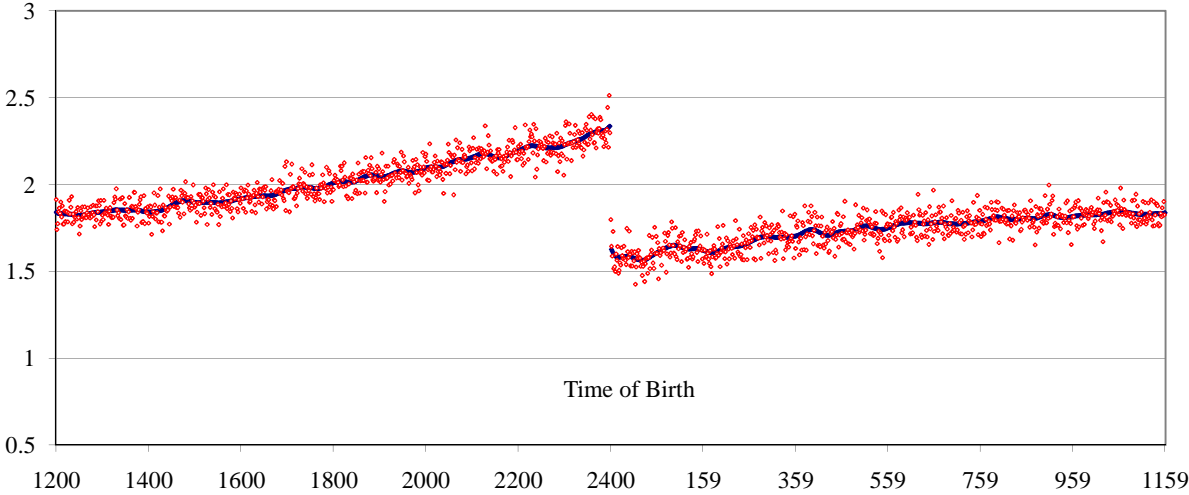

Figure A2B: Raw Length of Stay: After 1997 Law Change

Raw length of stay is the number of midnights in care. Points represent means within 1-minute intervals from 12:00 noon to 11:59am. Lines represent local linear regressions,  $h=20$ . The intercepts between Figures A2A and A2B differ so that they have the same scale.

Figure A3A: Bandwidth of 10:  
Additional Midnights Before Law Change

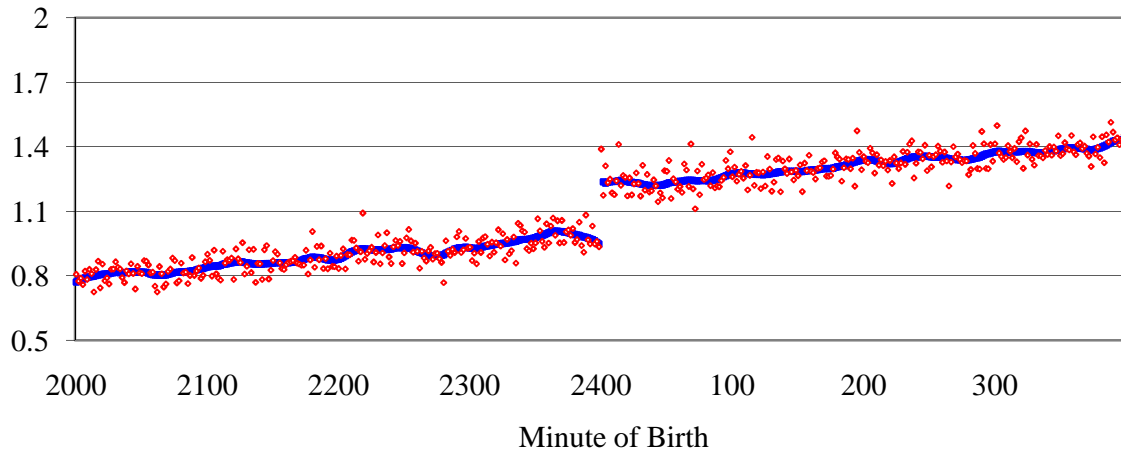

Figure A3B: Bandwidth of 10:  
Additional Midnights After Law Change

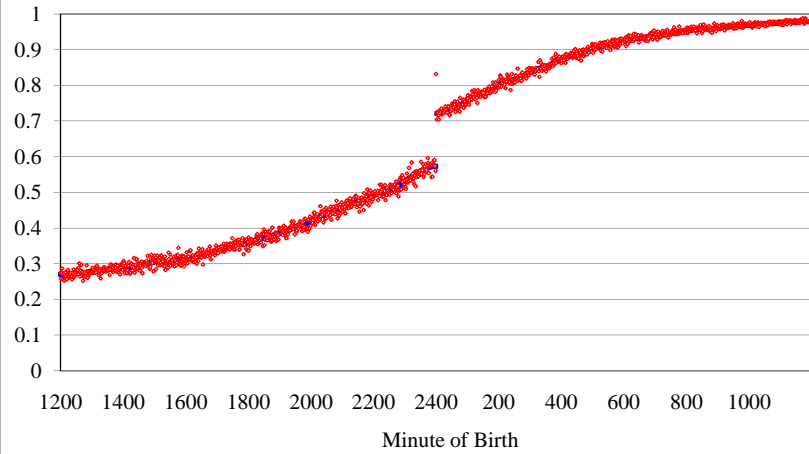

Figure A4B: 2 or More Additional Midnights: Before Law Change

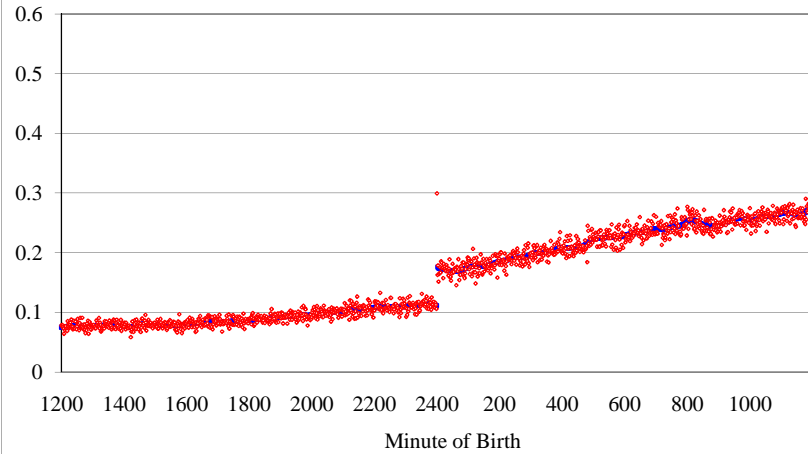

Figure A4C: 1 or More Additional Midnights: After Law Change

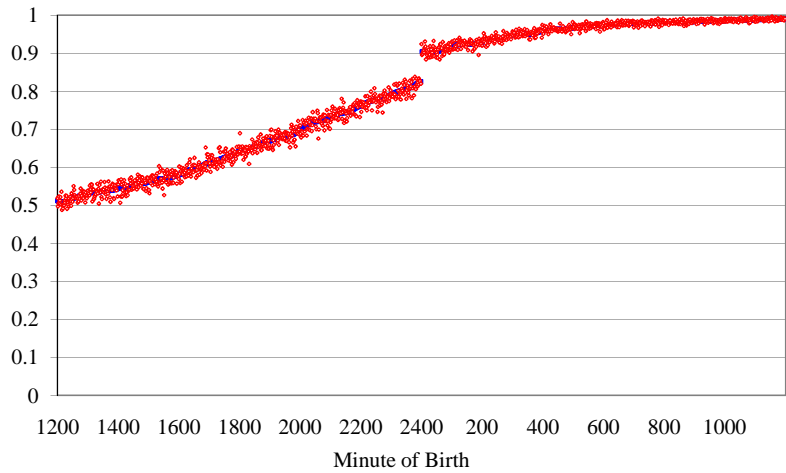

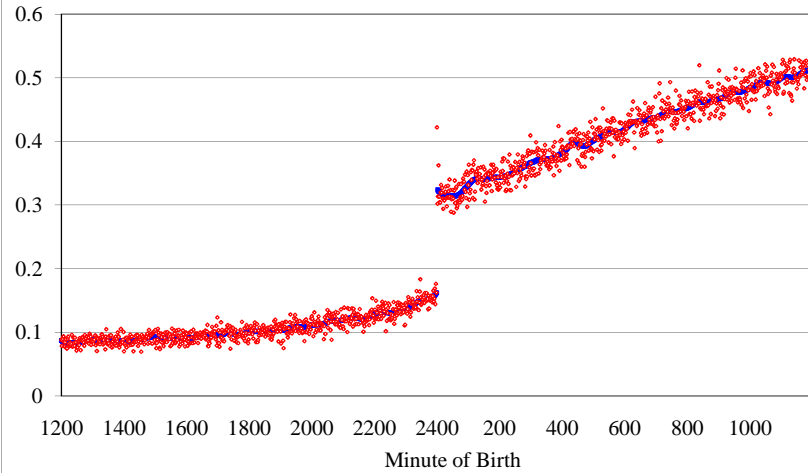

Figure A4D: 2 or More Additional Midnights: After Law Change

Number of additional midnights is the number of midnights for those born on or after midnight and before noon, while the number of additional midnights is measured as the number of midnights minus one for children born after noon and before midnight. Points represent means within 1-minute intervals from 12:00 noon to 11:59am. Lines represent local linear regressions,  $h=20$

Figure A5A: 7-Day Readmission Rate: Before Law Change

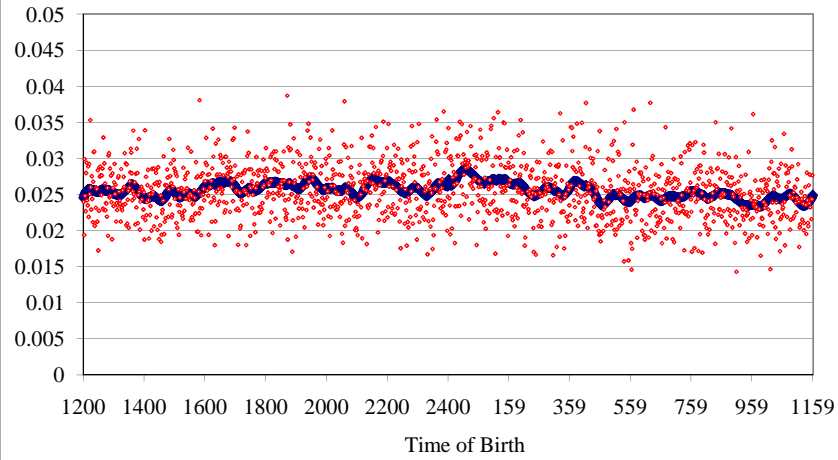

Figure A5B: Infant Mortality Rate: Before Law Change

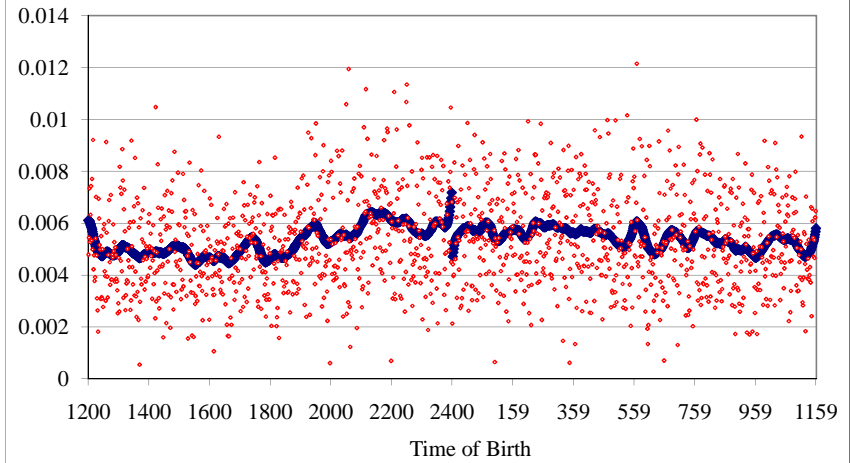

Figure A5C: 7-Day Readmission Rate: After Law Change

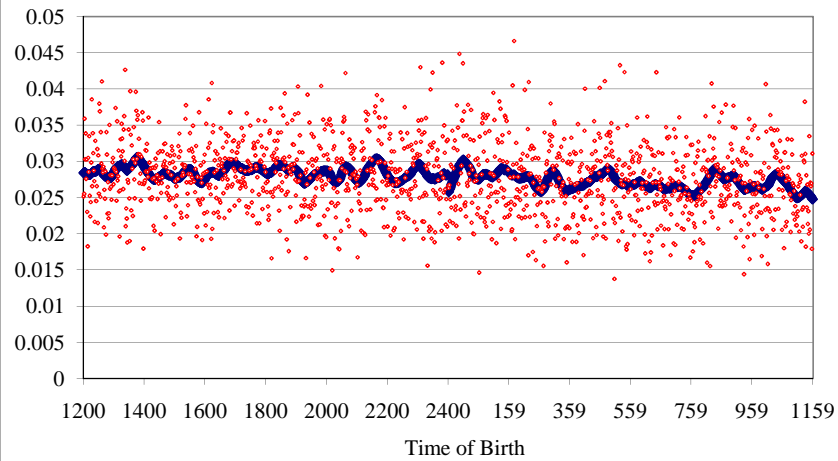

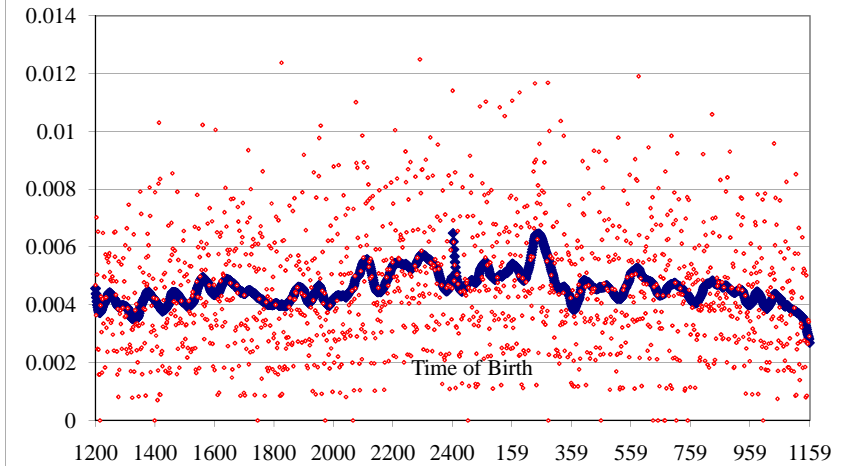

Figure A5D: Infant Mortality Rate: After Law Change

7-day measures consider 7 days since the midnight prior to those born between midnight and noon, and 7 days since the following midnight for those born between noon and midnight. Points represent means within 1-minute intervals from 12:00 noon to 11:59am. Lines represent local linear regressions,  $h=20$
